DETAILED ACTION

1. Claims 25-29 are pending in this office action, claims 27-29 are newly added.

Allowable Subject Matter

2. Claims 25-29 are allowed.
3. The following is an examiner's statement of reasons for allowance: the prior art of record fails to teach a SSL connection, where the server offloads the creation of the SSL connection once the connection has been initialized. In prior art systems, an SSL connection is established and the server is tied up with the client the entire time the session key is being created. The present invention starts the SSL connection, but hands-off the process to a separate process/processor to handle any negotiating so the server can process other requests from other clients. Once the client has created the session key, the separate process/processor hands-off the master key created by the client and separate process. The client is unaware of the fact that the session key was created by a separate process/processor than the server.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

4. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Brad Pedersen (U.S. Reg. No. 32,432) on March 20, 2007.

Claim 28 (Amended) The method of claim 25 wherein the hashing algorithm comprises an algorithm selected from the set consisting of one of: a Rivest Shamir Adelman (~~RAS~~) (RSA), a Message-Digest algorithm 5 (MD5) and a Secure Hash Algorithm (SHA).

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Patent No. 6,377,993 to Brandt et al. discloses a proxy for accepting client requests for SSL connections so that the client can initiate the process and then disconnect from the network. The client is able to reconnect later and poll the proxy to see if the connection is established. This differs from the instant application because the reference is an asynchronous transaction (the client disconnects from the internet during an SSL connection) whereas the instant application is a synchronous transaction (the client remains connected to the server and is unaware of a proxy establishing a SSL connection).
